[REDACTED]

To Whom it May Concern,

I have been seeing and treating [REDACTED] in clinic since 4/29/2022 for ADHD. She has been reporting heightened light sensitivity and pain related to exposure to LED lights at her work with [REDACTED] since her work schedule shifted to evenings in mid-July where LED exposure is greater than normal levels of daily living.

While [REDACTED] reports her eye doctor finds no functional problem with her eyes, in a study published in *Frontiers of Neurology* and available online via National Library of Medicine, 69% of people with ADHD have light sensitivity issues. As a result I think this is likely the cause of [REDACTED] light sensitivity issues which is exacerbated by the intensity of exposure she is currently experiencing. If there could be accommodations made that allow her to work in a safe and pain free environment, this would be optimal for her mental health.

Thank you for your consideration.

Sincerely,

Electronically Signed by: [REDACTED] PMHNP-BC, FNP-C
