Re: Spatially Anisotropic Visible-Radiation Devices

Dear Michelle Weil,

English Common Law dating back to 1663 states that a property owner has an easement to allow *light* to enter their property.¹ Light referred to sunlight and starlight that could be seen by human eyes. We now know that human-visible *light* is the set of frequencies between approximately 380nm and 700nm on the electromagnetic spectrum. For regulatory purposes and unless otherwise stated, *light* is spatially isotropic, meaning that the shape of the radiation is the same in all spherical directions.

Biological systems have a long history of evolution with *light*. The substance emitted by the sun, stars, fire, candles, and fireflies is *light* and is a fundamental component of biological life. Humans use their visual receptors to see objects using reflected *light*, the different wavelengths of *light* provide color information, and *light* controls circadian rhythms and mood. *Light is spatially isotropic radiation in the human visible portion of the electromagnetic spectrum*.

The substance emitted by LEDs is spatially anisotropic visible radiation. Specifically, the shape of the radiation is a Lambertian ball which is created because the source of the radiation is a flat surface.² Since this substance is not the same as that emitted by the spherical sun, the substance emitted by LEDs does not meet the standard regulatory definition of *light*. The radiation energy is different at every point in space, which is very different than the spatially uniform energy of *light*. Light Emitting Diodes are misnamed because they emit visible radiation, but not *light*. LEDs should more properly be named Visible Radiation Emitting Devices or VREDs. The substance emitted by LEDs has theoretically unlimited peak radiance, interferes with the nervous system and can cause eye damage, pain, epileptic seizures, migraines, psychiatric trauma, and thoughts of suicide.

Figure 1 is a diagram showing the categorization of radiation. Figure 1 shows that *light* is spatially isotropic radiation in the human visible portion of the electromagnetic spectrum and that the radiation emitted by LEDs, while visible, is not *light*.

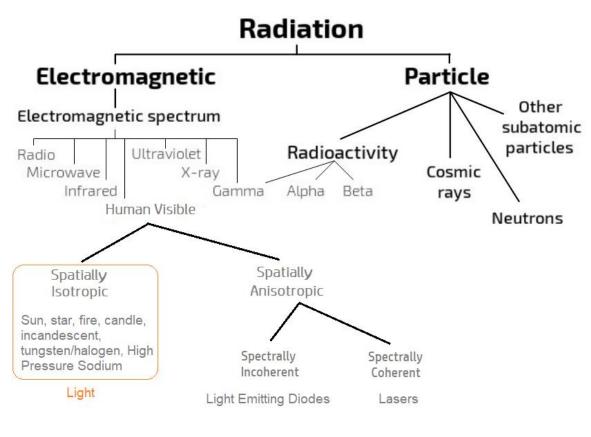

Figure 1 - Radiation Types

We wish to alert the Midcoast Community Council to liability issues related to the installation and operation of LED radiation devices. Figure 2 shows LED radiation devices at the El Granada Fire Station that are subjecting persons in the area to toxic, hazardous, and discriminatory radiation.

Figure 2 – El Granada Fire Station

The Illuminating Engineering Society Recommended Practice for Design and Maintenance for Roadway Parking Facility Lighting (IES RP-8-18) is the de-facto standard for outdoor lighting for streets and parking lots. Section 2.1 of this document states, "Radiant energy that is capable of exciting the retina and producing a visual sensation is consider *light.*" As noted earlier, a standards document such as IES RP-8-18 assumes the radiation to be spatially isotropic unless explicitly stated to be otherwise. Therefore, the references to *light* in IES RP-8-18, therefore, are for *spatially isotropic radiation in the visible portion of the electromagnetic spectrum*. The word *light* in IES RP-8-18 does not refer to microwaves, x-rays, or spatially anisotropic radiation such as LEDs and lasers.

The reason this is important is because San Mateo County has installed or is planning to install LED radiation devices that do not comply with existing standards, emit dangerous radiation, discriminate against persons with disabilities and have unregulated spatial, spectral, and temporal characteristics. Even more serious is the possible use of LED flashing radiation on police and other emergency vehicles which place lives in immediate danger due to the excessive peak radiance and anisotropic shape. LED radiation has been shown to cause pain, sickness, eye damage, seizures, migraines, emotional trauma, and thoughts of suicide.

The Illuminating Engineering Society does not guarantee their own standards and disclaims any liability for the use of their standards. Thus, if San Mateo County claims that they followed standards for LED radiation and are therefore not liable for the harms caused by the use of LEDs, San Mateo County's claim will fail, both because IES RP-8-18 is not applicable to LED radiation devices, and because IES has warned that their standards are not trustworthy enough to be guaranteed or relied on.

DISCLAIMER

IES publications are developed through the consensus standards development process approved by the American National Standards Institute. This process brings together volunteers representing varied viewpoints and interests to achieve consensus on lighting recommendations. While the IES administers the process and establishes policies and procedures to promote fairness in the development of consensus, it makes no guaranty or warranty as to the accuracy or completeness of any information published herein.

The IES disclaims liability for any injury to persons or property or other damages of any nature whatsoever, whether special, indirect, consequential or compensatory, directly or indirectly resulting from the publication, use of, or reliance on this document.

In issuing and making this document available, the IES is not undertaking to render professional or other services for or on behalf of any person or entity. Nor is the IES undertaking to perform any duty owed by any person or entity to someone else. Anyone using this document should rely on his or her own independent judgment or, as appropriate, seek the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

The IES has no power, nor does it undertake, to police or enforce compliance with the contents of this document. Nor does the IES list, certify, test or inspect products, designs, or installations for compliance with this document. Any certification or statement of compliance with the requirements of this document shall not be attributable to the IES and is solely the responsibility of the certifier or maker of the statement. To our knowledge, there are no ocular exposure standards for LEDs. In his 2009 presentation, Senior Engineer Michael Shulman of Underwriters Laboratories wrote, "Currently, neither the U.S. nor Canada have mandatory standards or regulations for ocular exposure to LEDs emitting incoherent visible light."³ In the research article, titled Light Emitting Diode Induced Retinal Damage⁴ the authors state, "*Excessive LED light exposure presents a potential hazard to retinal function*." In other research, those in Risk Group 3 (those with epilepsy, autism, migraines, photophobia, etc.) are often purposely ignored during the research, invalidating results that might have shown that LEDs are safe.

LEDs are not "energy efficient". To be energy efficient, a technology must provide the same quality of service and perform the same task as the previous technology⁵. The task in this situation is to provide *light* and uniform illumination while using less energy and not causing harm. Since LEDs do not emit spatially isotropic radiation, LEDs are not illumination devices, as the radiation that LEDs emit is not uniform. Instead, LEDs emit spatially anisotropic visible radiation that is sending people to the hospital, causing eye damage, and violating civil rights. The claim of "energy efficiency" by the LED lighting industry is fraudulent.

The federal Americans with Disabilities Act prohibits discrimination. Since LED radiation interferes with major life functions such as seeing, thinking, and concentrating for people with disabilities, such as those with epilepsy, autism, PTSD, migraines, bipolar disorder and others, LED radiation is discriminatory. San Mateo County cannot claim that LEDs comply with the ADA just because the US Access Board has not yet developed guidelines for spatially anisotropic radiation from LEDs. Since LED radiation prevents safe access to public services such as roads, sidewalks and government facilities, LED radiation is discriminatory. We do not see any information on San Mateo County's website that indicates that San Mateo County authorized studies or even reviewed the impacts of LED radiation on those with disabilities.

As an example of how dangerous LED radiation is, consider this warning shown in Figure 3 from the company Gear Light.

Figure 3 - LED Flashlight

⁴ <u>https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5313540/</u>

⁵ <u>https://www.energystar.gov/about/about_energy_efficiency</u>

The fact that LEDs do not emit the regulatory definition of *light*, are unregulated and lack standards, cause sickness and eye damage, interfere with the human nervous system, and discriminate against people with disabilities makes San Mateo County liable for the harm and discrimination they cause because San Mateo County authorizes the installation and operation of LED radiation devices.

To protect human health and reduce liability, San Mateo County must protect the natural night resource, and set policy to limit visible radiation. Any artificial radiation used for illumination must use *only spatially isotropic* radiation with a Correlated Color Temperature of 2700 Kelvin or less, with 2000K preferred to protect the natural night resource, and be fully shielded (not just full cutoff). Pulsing LED radiation such as on police cars, other emergency vehicles and utility trucks, and signs must be eliminated completely due to their civil rights violations and the excessive danger they pose.

Sincerely,

Mark Baker
